

# Planitec WebServices API — v3.7

---

## Introduction

All requests to Planitec Web services are made using the MSTE protocol. MSTE is an open-source JSON based serialization protocol admitting to encode cyclic graphs of objects.

Since MSTE is like a binary in JSON encoding, the description of the API will use a plist-like syntax to describe the objects contained in requests and returned data.

## API list

The Planitec Web services API contains the following requests :

| Request                              | Description  |
|--------------------------------------|--|
| <code>/getCapabilities</code>        | returns global informations about the current web service  |
| <code>/getUsersList</code>           | returns a list of users like associations, companies, organisms, persons, members or associations containing members                             |
| <code>/getPlacesList</code>          | returns a list of places used for reservations   |
| <code>/getReservationsList</code>    | returns a list of reservations matching filter parameters  |
| <code>/getUsersInfo</code>           | returns complete informations about a given users list   |
| <code>/getPlacesInfo</code>          | returns complete informations about a given places list  |
| <code>/getReservationsInfo</code>    | returns standard status informations about a given reservations list   |
| <code>/getGaps</code>                | returns a list of gaps for a list of places, users, activities... intersecting a range of date   |
| <code>/getFreeGaps</code>            | returns a list of free gaps in a list of places for a dates range, a list of reservation days and a duration or a given starting and ending time |
| <code>/createPerson</code>           | create a new person which could be later used for reservation  |
| <code>/updatePerson</code>           | modify the basic information of a person   |
| <code>/createReservation</code>      | create a new reservation tagged as temporary and coming from the net.  |
| <code>/updateReservation</code>      | change a reservation status from temporary to standard to confirmed or to invalid  |
| <code>/addReservationDocument</code> | add a document to an existing reservation  |
| <code>/getCivilities</code>          | returns a list of known civilities   |
| <code>/getActivities</code>          | returns the list of standard activities used for reservation   |
| <code>/getActivityTypes</code>       | returns the list of activity types used in standard Planitec activities  |

| Request                                 | Description  |
|---|--|
| <code>/getDocumentTypes</code>          | returns a list of known document types   |
| <code>/getFutureReservationPrice</code> | returns the potential price of a reservation made on a resource with automatic price |
| <code>/getReservationType</code>        | returns a list of known reservation types  |
| <code>/logEvents(*)</code>              | logging external events in Planitec database   |

(\*) interface in evolution. Keep using V2 for now.

All response to requests are expressed as a MSTE dictionary containing at least :

```
{
  requestName = "getCapabilities" ;
  requestDate = 2015/08/06-17:22:36 ;
  responseDate = 2015/08/06-17:22:37 ;

  ... other informtions returned (depending on the request)
}
```

## Connection

In order to be able to access the following API, you must be connected. The connection is held by a session cookie.

In order to authenticate the connection you first must send the `MH-LOGIN` header with the desired login. You will get a challenge in the body of the response.

With this challenge and the associated password, a challenged password is built.

The challenge is composed of 6 parts: `algorithm1:hardness1<salt1>algorithm2:hardness2<salt2>`.

There is only one available algorithm at the moment: `1` (SHA512\_N).

In order to get the challenged password you must do:

```
s1 = hash(salt1 + password)
do hardness1 times:
  s1 = hash(s1)
t1 = str2hex(s1) # uppercase hex representation of s1

s2 = hash(salt2 + t1)
do hardness2 times:
  s2 = hash(s2)
challenged_password = str2hex(s2) # uppercase hex representation of s2
```

This challenged password is then send by a new request through the `MH-PASSWORD` header. If the server answer is 200 SUCCESS, you are authenticated.

```
sequenceDiagram
    Client ->> Server: header MH-LOGIN: login
    Server->> Client : body is the challenge challenge & header Set-Cookie
    Client ->> Server: Cookie & header MH-PASSWORD: challenged password
    Server->> Client : OK
```

## getCapability

Request parameters :

NONE

Request output :

```
informations = {
  database = {
    type = "aString" ; // database engine ("Oracle", "SQLServer", MySQL" ...)
    modelVersion = "V.S" ; // V = version / S = sub version (ex: "1.0")
  } ;
  service = {
    version = "V.R.C" ; // api version Version.Release.Ccompilation (ex: "1.0.0")
    name = "sString" ; //Common name of the web service
    availableAPIs = ("getUsersInfo", "getGaps", ...) ; //list of available
requests
  } ;
} ;
```

## getUsersList

This requests returns a list of users managed by the connected operator.

Request parameters :

```
usersType = "aString" ; // type of users list we seek (description below)
role = "aString" ; // for now role is optional and if set is "reservationOperator"
```

The list of **usersType** can be one of the following value :

| <b>usersType (string)</b> | <b>Description</b>            |
|---------------------------|-------------------------------|
| <b>all</b>                | All the managed users         |
| <b>associations</b>       | Only the managed associations |
| <b>persons</b>            | Only the managed persons      |
| <b>organisms</b>          | Only the managed organisms    |

| <b>usersType (string)</b> | <b>Description</b> |
|---------------------------|--------------------|
|---------------------------|--------------------|

|                  |                            |
|------------------|----------------------------|
| <b>companies</b> | Only the managed companies |
|------------------|----------------------------|

Request output :

```

usersList = (
  {
    identifier = 999 ; // internal planitec's user unique identifier
    label = "aString" ; // label of the user to be displayed in your list
    type = 9 ; // absent if the asked category is specified in request
                // otherwise 1 = person, 2 = company, 3 = association, 4 = organism
    externalIdentifier = "aString" ; // user external identifier
    name = "aString" ; // only set for a person
    firstName = "aString" ; // only set for a person
  }, ...
  {
    identifier = 999 ;
    label = "xxx" ;
    type = 9 ;
  }
) ;

```

If the connected operator has no managed users in the asked category, an empty **usersList** array is returned.

Release notes V3.2 :

- **name** and **firstName** fields have been added to the response for human users
- **externalIdentifier** field has been added in order to permit comparison by the operator

Release notes V3 :

- **externalUserID** field is no longer supported in this request
- **usersType** field values **memberIn** and **associationsWithMemberIn** are no longer supported in this request
- the returned **usersList** objects now contains a **type** field instead of a **name** field. This new **type** field is set only if the requested **usersType** is et to **all**.

## getPlacesList

This requests returns a list of places managed by the connected operator.

Request parameters :

```
userID = 999 ; // an optional planitec userID considered as the places manager
role = "aString" ; // for now role is optional and if set is "reservationOperator"
```

if no userID is set, the request returns all the managed places

Request output :

```
placesList = (
  {
    identifier = 999 ; // internal planitec's place unique identifier
    label = "aString" ; // label of the place to be displayed in your list
  },
  ...
) ;
```

If the connected operator has no managed users in the asked category, an empty `placesList` array is returned.

Release notes V3 :

- the returned `placesList` objects don't have a `name` field anymore.
- the request does not use a `peopleID` field anymore. It has been replaced by the field `userID`. The `peopleID` field is still considered as valid but obsolete.

## getReservationsList [new in version 3.7]

This requests allow the current operator to retrieve planning reservations with filter on dates, places, users and activities.

Request parameters :

The requested parameters for this request are described in the following table :

| Parameter                     | Type                                  | Mandatory | Description  |
|-------------------------------|---------------------------------------|-----------|--|
| <code>start</code>            | DateTime                              | YES       | Precise date from when we want to fetch gaps   |
| <code>end</code>              | DateTime                              | YES       | Precise date to when we want to fetch gaps   |
| <code>placeIdentifiers</code> | Array of UInt32                       | NO        | List of Planitec's place IDs from where we want to fetch gaps  |
| <code>userIdentifiers</code>  | Array of UInt32 or String Identifiers | NO        | List of Planitec's user IDs or externalIdentifiers (you can mix) to define the contractors from whom we want to fetch gaps |

| Parameter                        | Type            | Mandatory | Description   |
|----------------------------------|-----------------|-----------|---|
| <code>activityIdentifiers</code> | Array or UInt32 | NO        | List of Planitec activity IDs to define the activities from which we want to fetch gaps |

Request output :

```

reservationsList = (
  {
    identifier = 999 ; // internal planitec's reservation unique identifier
    label = "aString" ; // label of the reservation to be displayed in your
list
    startingDate = aDate ; // starting date of the reservation
    endingDate = aDate ; // ending date of the reservation
  },
  ...
) ;

```

## getUsersInfo

This requests returns complete informations about the asked user identifiers.

Request parameters :

```

userIdentifiers = () ; // an array of asked user identifiers (description below)
// (you can also use "users" as backward compatibility)
extensionAttributes = {} // a dictionary of User extensions we want to get
// with each user (description bellow)

```

The array of `userIdentifiers` (or `users`) should be set for the request to be valid. This `userIdentifiers` array is composed by a list of entries which can be one of this kind :

| Entry type | Format   | Description   |
|------------|--|---|
| String     | a non empty string   | The external identifier of a People object you want to fetch.                                       |
| Number     | a non null unsigned int number.  | The Planitec internal identifier of a People object you want to fetch.                              |
| Dictionary | One <code>"Identifier"</code> key which has an unsigned int number value | The Planitec internal identifier of a People object you want to fetch (for backward compatibility). |
| Dictionary | One <code>"Identifier"</code> key which has a non empty string value     | The external identifier of a People object you want to fetch (for backward compatibility).          |

The `extensionAttributes` dictionary should contains a list of key/values pairs. Each key will be the future key used in the `User` object you will get in the request output. Beware not to overwrite an existing key (see below) by a new key you put in `extensionAttributes` dictionary. Each value of the key/value pair in this dictionary define the kind of extension you want to get from Planitec database. The definition itself is a dictionary with 2 mandatory entries and an optional third :

```
myExtension = {
  name = "EXTENSION_NAME" ; // mandatory planitec extension name
  type = "aType" ; // mandatory planitec extension type ("string", "int",
    // "unsigned", "float", "bool", "date" or "color")
  defaultValue = aValue ; // can be a String, a Date, a MSTE color object...
} ;
```

### System extensions :

Using the extension mechanism, you can retrieve all users extensions including the Planitec's system extensions. Beware, all extensions listed here are not used in all Planitec configurations.

| Planitec Extension | Type   | Perimeter             | Description                    |
|--------------------|--------|-----------------------|--------------------------------|
| _BIRTHDAY_         | date   | Only for persons      | Birthday of person             |
| CORRES_1           | string | Only for moral people | Contact name (deprecated)      |
| CORRESBIS_1        | string | idem                  | Second contact name            |
| STREET_1           | string | idem                  | Contact street number          |
| ADR1_1             | string | idem                  | Contact address line 1         |
| ADR1_2             | string | idem                  | Contact address line 2         |
| ZIP_1              | string | idem                  | Contact zip code               |
| CITY_1             | string | idem                  | Contact city                   |
| TEL_1              | string | idem                  | Contact phone                  |
| MOBILE_1           | string | idem                  | Contact mobile phone           |
| FAX_1              | string | idem                  | Contact fax                    |
| EMAIL_1            | string | idem                  | Contact email                  |
| CORRES_2           | string | idem                  | Invoice contact name           |
| CORRESBIS_2        | string | idem                  | Second invoice contact name    |
| STREET_2           | string | idem                  | Invoice contact street number  |
| ADR_2_1            | string | idem                  | Invoice contact address line 1 |
| ADR_2_2            | string | idem                  | Invoice contact address line 2 |
| ZIP_2              | string | idem                  | Invoice contact zip code       |

| Planitec Extension | Type   | Perimeter          | Description                                   |
|--------------------|--------|--------------------|---|
| CITY_2             | string | idem               | Invoice contact city                          |
| TEL_2              | string | idem               | Invoice contact phone                         |
| MOBILE_2           | string | idem               | Invoice contact mobile phone                  |
| FAX_2              | string | idem               | Invoice contact fax                           |
| EMAIL_2            | string | idem               | Invoice contact email                         |
| WEB_URL            | string | idem               | Organism, company or association web site URL |
| KAPITAL            | int    | Only for companies | Company capital                               |
| COMMENTARY         | string | all users          | Commentaries about the user                   |

Request output :

```

requestedUsers = ( ... ) ; // an array of the requested users infos
allUsers = ( ... ) ; // an array of all fetched users (including parents,
children)
rootUsers = ( ... ) ; // an array of all root users fetched

allUserTypes = ( ... ) ; // all types fetched for fetched users
allFunctions = ( ... ) ; // all functions fetched for fetched users
allActivities = ( ... ) ; // all activities fetched for fetched users
allBadges = ( ... ) ; // all fetched badges for fetched users
allBadgeTypes = ( ... ) ; // all fetched badge types for fetched badges

```

Each **User** object described in **requestedUsers**, **allUsers** and **rootUsers** arrays and **employees**, **members**, **electeds**, **parentUser** and **children** relationships contains the following attributes :

| Attribute                 | Type   | Size<br>max | allowsNull | Description  |
|---------------------------|--------|-------------|------------|--|
| <b>identifier</b>         | UInt32 |             | NO         | Planitec internal user identifier  |
| <b>externalIdentifier</b> | String | 64          | YES        | External user identifier   |
| <b>label</b>              | String | 151         | NO         | Complete user name (can be computed)   |
| <b>name</b>               | String | 100         | NO         | User name (2 character mini)   |
| <b>firstName</b>          | String | 50          | YES        | User first name  |
| <b>originalName</b>       | String | 100         | YES        | User maiden name   |
| <b>administrativeCode</b> | String | 50          | YES        | Person social security number or association, organism or company registration number. |

| Attribute           | Type     | Size max | allowsNull | Description   |
|---------------------|----------|----------|------------|---|
| code                | String   | 20       | YES        | User code for internal or external import purpose (was previously <code>internalCode</code> ) |
| modificationDate    | DateTime |          | NO         | Last object modification DateTime stamp   |
| parentsPath         | String   | 512      | YES        | Path of the parents composed by the id of each parent people separated by '/' (eg: "1/2/3").  |
| streetNumber        | String   | 10       | YES        |   |
| address1            | String   | 100      | YES        | first line of address   |
| address2            | String   | 100      | YES        | second line of address  |
| zipCode             | String   | 10       | YES        |   |
| city                | String   | 50       | YES        |   |
| tel1                | String   | 20       | YES        | phone number 1  |
| tel2                | String   | 20       | YES        | phone number 2  |
| fax                 | String   | 20       | YES        | fax number  |
| email               | String   | 128      | YES        | email   |
| geox                | Float    |          | YES        | x projected localization  |
| geoy                | Float    |          | YES        | y projected localization  |
| parentUser          | Object   |          | YES        | parent User object  |
| children            | Array    |          | YES        | array of children objects (array of User objects)   |
| type                | Object   |          | YES        | type object of the user (a UserType object)   |
| juridicType         | Object   |          | YES        | juridic type object of the user (a UserType object). This attribute is the user's civility.   |
| badges              | Array    |          | YES        | array of Badge objects possessed by the user  |
| practicedActivities | Array    |          | YES        | array of Activity objects describing for moral person the activities they offer               |
| employees           | Array    |          | YES        | array of User objects which are employees   |
| members             | Array    |          | YES        | array of User objects which are members   |
| electeds            | Array    |          | YES        | array of User objects which are elected officials   |

Each `UserType` object described in `type` and `juridicType` relationships contains the following attributes :

| Attribute                     | Type     | Size max | allowsNull | Description                                 |
|-------------------------------|----------|----------|------------|---|
| <code>identifier</code>       | UInt32   |          | NO         | Planitec internal user type identifier      |
| <code>label</code>            | String   | 100      | NO         | User type name (2 characters min)           |
| <code>code</code>             | String   | 20       | YES        | User type code                              |
| <code>category</code>         | UInt32   | 1        | YES        | absent or 0 = standard, 1 = juridic type    |
| <code>modificationDate</code> | DateTime |          | NO         | Last object modification DateTime stamp     |
| <code>users</code>            | Array    |          | NO         | array of Users objects which have that type |

Each Activity Object described in `practicedActivities` Array contains the following attributes:

| Attribute                     | Type     | Size max | allowsNull | Description                                |
|-------------------------------|----------|----------|------------|--|
| <code>identifier</code>       | UInt32   |          | NO         | Planitec internal activity identifier      |
| <code>activityTypeID</code>   | UInt32   |          | YES        | Planitec internal activity type identifier |
| <code>label</code>            | String   | 100      | NO         | Activity name                              |
| <code>modificationDate</code> | DateTime |          | NO         | Last object modification DateTime stamp    |

Each `Badge` object described in `badges` relationship contains the following attributes :

| Attribute                     | Type     | Size max | allowsNull | Description   |
|-------------------------------|----------|----------|------------|---|
| <code>identifier</code>       | UInt32   |          | NO         | Planitec internal badge identifier  |
| <code>number</code>           | UInt32   |          | NO         | Badge number.   |
| <code>serialNumber</code>     | String   | 100      | NO         | badge serial number   |
| <code>label</code>            | String   | 30       | NO         | Generally a less than 30 characters string composed by the technology code (20 characters max) and the badge number (10 decimal digits max) |
| <code>ownerName</code>        | String   | 151      | NO         | Owner complete name. Obsolete as <i>redundant information with user.label. Should disappear in future versions.</i>                         |
| <code>isMasterBadge</code>    | Boolean  |          | YES        | absence is equivalent to the NO value   |
| <code>modificationDate</code> | DateTime |          | NO         | Last object modification DateTime stamp   |
| <code>user</code>             | Object   |          | NO         | the User object this badge belongs to   |
| <code>type</code>             | Object   |          | YES        | The badge's type as a <code>BadgeType</code> object.  |

Each `BadgeType` object described in the previous `type` relationship in `Badge` object contains the following attributes :

| Attribute                     | Type     | Size max | allowsNull | Description                                      |
|-------------------------------|----------|----------|------------|--|
| <code>identifier</code>       | UInt32   |          | NO         | Planitec internal badge type identifier          |
| <code>label</code>            | String   | 100      | NO         | Badge type (technology) name (2 characters mini) |
| <code>code</code>             | String   | 20       | YES        | Badge technology code name                       |
| <code>modificationDate</code> | DateTime |          | NO         | Last object modification DateTime stamp          |
| <code>badges</code>           | Array    |          | NO         | array of Badges objects which have that type     |

### Release notes V3 :

- `users` request field has been replaced by `userIdentifiers`. The previous `users` field can still be used has backward compatibility but is considered as obsolete.
- `User` objects fields évolution :
  - added `originalName`, `externalIdentifier`, `fax`, `juridicType` and `geox` and `geoy` fields
  - field `code` replaces old `internalCode` field
- `Badge` objects `ownerName` field is now tagged as obsolete
- Request now accepts to fetch Planitec extensions on `User` objects.
- `UserType` objects have now a `category` field, 0 = standard, 1 = juridic type

## getPlacesInfo

This requests returns complete informations about the asked places identifiers.

### Request parameters :

```
placeIdentifiers = () ; // an array of asked user identifiers (description below)
                        // (you can also use "places" as backward compatibility)
extensionAttributes = {} // a dictionary of User extensions we want to get
                        // with each place (description bellow)
fetchPlacesImages = true OR false ; // a boolean indicating if we fetch the
internal and external images of the places
```

The `placeIdentifiers` array is a list a Planitec's `Place` identifiers. All these identifiers are positive numbers.

The `extensionAttributes` dictionary follows the same rules as described in `getUsersInfo` request.

### System extensions :

Using the extension mechanism, you can retrieve places extensions including the Planitec's system extensions.

| Planitec Extension | type   | Description                  |
|--------------------|--------|------------------------------|
| COUNTY             | string | County (Canton)              |
| SECTOR             | string | Sector (Arrondissement)      |
| CITY_CODE          | string | CityCode (Commune)           |
| COMMENTARY         | string | Commentaries about the place |
| TOTCAP             | int    | Place total capacity         |
| SEATCAP            | int    | Seating place capacity       |
| STANDCAP           | int    | Standing place capacity      |
| SURFACE            | int    | Place surface                |
| DIMENSIONS         | string | Place dimension description  |

Request output :

```
requestedPlaces = (...) ; // an array of the requested users infos
allPlaces = (...) ; // an array of all fetched places (including parents,
children)
rootPlaces = (...) ; // an array of all root places fetched
allPlaceTypes = ( ... ) ; // all types fetched for fetched places
allActivities = ( ... ) ; // all activities fetched for fetched places
allTriggers = ( ... ) ; // all fetched triggers for fetched places
```

Each **Place** object described in **requestedPlaces**, **allPlaces** and **rootPlaces** arrays and **parentPlace**, **substitutions** and **children** relationships contains the following attributes :

| Attribute                 | Type     | Size max | allowsNull | Description   |
|---------------------------|----------|----------|------------|---|
| <b>identifier</b>         | UInt32   |          | NO         | Planitec internal place identifier  |
| <b>resourceIdentifier</b> | UInt32   |          | NO         | Planitec internal place's twin resource identifier  |
| <b>label</b>              | String   | 100      | NO         | User name (2 character mini)  |
| <b>code</b>               | String   | 20       | YES        | Place code for internal or external import purpose (was previously <b>internalCode</b> )    |
| <b>modificationDate</b>   | DateTime |          | NO         | Last object modification DateTime stamp   |
| <b>parentsPath</b>        | String   | 512      | YES        | Path of the parents composed by the id of each parent place separated by '/' (eg: "1/2/3"). |
| <b>streetNumber</b>       | String   | 10       | YES        |   |

| Attribute      | Type       | Size max | allowsNull | Description   |
|----------------|------------|----------|------------|---|
| address1       | String     | 100      | YES        | first line of address   |
| address2       | String     | 100      | YES        | second line of address  |
| zipCode        | String     | 10       | YES        |   |
| city           | String     | 50       | YES        |   |
| tel1           | String     | 20       | YES        | phone number 1  |
| tel2           | String     | 20       | YES        | phone number 2  |
| fax            | String     | 20       | YES        | fax number  |
| email          | String     | 128      | YES        | email   |
| geox           | Float      |          | YES        | x projected localization  |
| geoy           | Float      |          | YES        | y projected localization  |
| provisionTime  | Int32      |          | YES        | default time necessary for setting up the place   |
| returnTime     | Int32      |          | YES        | default time necessary to clean the place   |
| parentPlace    | Object     |          | YES        | parent Place object   |
| children       | Array      |          | YES        | array of children objects (array of Place objects)  |
| type           | Object     |          | YES        | type object of the user (a PlaceType object)  |
| triggers       | Array      |          | YES        | array of Trigger objects attached to the Place object   |
| activities     | Array      |          | YES        | array of Activity objects which could be practices by users this place  |
| substitutions  | Array      |          | YES        | array of Places objects which can be used as substitutions places for this place if it is occupied  |
| inddorsPicture | Dictionary |          | YES        | Only present if the parameter boolean fetchPlacesImages is set to true and if there's really an indoor image of the place. Returned dictionary contains the key name containing the name of the image and its extension and the key data containing the image itself. |

| Attribute                    | Type       | Size max | allowsNull | Description  |
|------------------------------|------------|----------|------------|--|
| <code>outdoorsPicture</code> | Dictionary |          | YES        | Only present if the parameter boolean <code>fetchPlacesImages</code> is set to true and if there's really an outdoors image of the place. Returned dictionary contains the key name containing the name of the image and its extension and the key data containing the image itself. |

Each `PlaceType` object described in `type` relationship contains the following attributes :

| Attribute                     | Type     | Size max | allowsNull | Description                                 |
|-------------------------------|----------|----------|------------|---|
| <code>identifier</code>       | UInt32   |          | NO         | Planitec internal place type identifier     |
| <code>label</code>            | String   | 100      | NO         | Place type name (2 characters min)          |
| <code>code</code>             | String   | 20       | YES        | Place type code                             |
| <code>modificationDate</code> | DateTime |          | NO         | Last object modification DateTime stamp     |
| <code>places</code>           | Array    |          | NO         | array of Place objects which have that type |

Each `Activity` Object described in `activities` relationship contains the following attributes:

| Attribute                     | Type     | Size max | allowsNull | Description                                |
|-------------------------------|----------|----------|------------|--|
| <code>identifier</code>       | UInt32   |          | NO         | Planitec internal activity identifier      |
| <code>activityTypeID</code>   | UInt32   |          | YES        | Planitec internal activity type identifier |
| <code>label</code>            | String   | 100      | NO         | Activity name                              |
| <code>modificationDate</code> | DateTime |          | NO         | Last object modification DateTime stamp    |
| <code>places</code>           | Array    |          | NO         | List of places where this activity is done |

Each `Trigger` object described in `triggers` relationship contains the following attributes :

| Attribute                     | Type     | Size max | allowsNull | Description                             |
|-------------------------------|----------|----------|------------|---|
| <code>identifier</code>       | UInt32   |          | NO         | Planitec internal trigger identifier    |
| <code>label</code>            | String   | 100      | NO         | Trigger name                            |
| <code>modificationDate</code> | DateTime |          | NO         | Last object modification DateTime stamp |
| <code>places</code>           | Array    |          | NO         | All places where this trigger appears   |

Release notes V3.5 :

- `fetchPlacesImages` request parameter if set to true indicates what you want potential `indoorsPicture` and `outdoorsPicture` to be filled for each place

- **Place** objects fields évolution :
  - added **indoorsPicture** field which contain a dictionary with **name** field indicating the original name of the image (with its extension) and a **data** field containing the image itself.
  - added **outdoorsPicture** field which contain a dictionary with **name** field indicating the original name of the image (with its extension) and a **data** field containing the image itself.

### Release notes V3 :

- **places** request field has been replaced by **placeIdentifiers**. The previous **places** field can still be used has backward compatibility but is considered as obsolete.
- **Place** objects fields évolution :
  - added **resourceIdentifier**, **fax**, **provisionTime**, **returnTime**, **geox** and **geoy** fields
  - field **code** replaces old **internalCode** field
- Request now accepts to fetch Planitec extensions on **Place** objects.

## getReservationsInfo [new request in V3]

This requests returns complete informations about the asked reservations identifiers. Warning, this request does not fetch any gaps, it's only information status about reservations

### Request parameters :

```
reservationsIdentifiers = ( ) ; // an array of asked reservation identifiers
                             // (description below)
extensionAttributes = {} // a dictionary of User extensions we want to get
                        // with each place (description bellow)

fetchReservationGaps = true OR false ; // an optional boolean indicating if we
fetch the gaps of selected reservations. Default is false.
```

The **reservationsIdentifiers** array is a list a Planitec's **Reservations** UInt32 identifiers.

The **extensionAttributes** dictionary follows the same rules as described in getUsersInfo request.

### Common extensions :

Using the extension mechanism, you can retrieve all reservations extensions including these common ones :

| Common Extension | Type   | Description   |
|------------------|--------|---|
| COMMENTARY       | string | Commentary of the reservation (system extension) [ <i>OBSOLETE</i> : in v3.5, you directly have access to a commentary field] |
| MINUT_ENTREE     | string | Only for BODET access systems. Returns a string containing an unsigned value in minutes                                       |

| Common Extension | Type   | Description   |
|------------------|--------|---|
| MINUT_SORTIE     | string | Only for BODET access systems. Returns a string containing an unsigned value in minutes   |
| TYPE_CRENEAU     | string | Only for BODET access systems. Returns a string containing an unsigned code : 2 = "Badgeage", 11 = "Libre", 12 = "Libre après premier badgeage ». |
| DEL_PRE          | string | Delay in minutes for heating. Returns a string containing an unsigned value   |
| DEL_FERM         | string | Delay in minutes before closing. Returns a string containing an unsigned value  |
| DEL_OUV          | string | Delay in minutes before opening. Returns a string containing an unsigned value  |

Request output :

```
requestedReservations = (...) ; // an array of the requested users infos
allReservationTypes = ( ... ) ; // all types fetched for fetched reservations
allActivities = ( ... ) ; // all activities fetched for fetched reservations
```

Each **Reservation** object and objects described in **requestedReservations** array contains :

| Attribute                     | Type     | Size max | allowsNull | Description   |
|-------------------------------|----------|----------|------------|---|
| <b>identifiant</b>            | UInt32   |          | NO         | Planitec internal reservation identifier                                  |
| <b>label</b>                  | String   | 100      | NO         | Reservation object  |
| <b>modificationDate</b>       | DateTime |          | NO         | Last object modification DateTime stamp                                   |
| <b>isSingle</b>               | Boolean  |          | NO         | Does the reservation contains one gap or multiple gaps                    |
| <b>isLocked</b>               | Boolean  |          | NO         | Is the reservation user locked  |
| <b>code</b>                   | String   | 20       | YES        | Internal reservation code   |
| <b>start</b>                  | DateTime |          | NO         | Reservation starting date & time  |
| <b>end</b>                    | DateTime |          | NO         | Reservation ending date & time  |
| <b>previsionalRegistereds</b> | UInt32   |          | NO         | Previsional people coming (can be 0)                                      |
| <b>registereds</b>            | UInt32   |          | NO         | People who did come (can be 0)  |
| <b>situation</b>              | Char     |          | NO         | 0 = invalid, 1 = pre-reservation, 2 = standard reservation, 3 = confirmed |
| <b>activity</b>               | Object   |          | NO         | The reservation activity  |

| Attribute                | Type          | Size max | allowsNull | Description   |
|--------------------------|---------------|----------|------------|---|
| <code>type</code>        | Object        |          | YES        | The reservation type  |
| <code>contractor</code>  | Object        |          | NO         | The reservation contractor  |
| <code>price</code>       | Int32         |          | NO         | The reservation price (without VAT) in 1/1000 of the current money unit   |
| <code>vat</code>         | Int32         |          | NO         | The reservation VAT ) in 1/1000 of the current money unit   |
| <code>commentary</code>  | String        |          | YES        | Commentary of the reservation   |
| <code>validGaps</code>   | Array of Gaps |          | YES        | List of valid gaps of the reservation. Fetched only if the boolean <code>fetchReservationGaps</code> is set to true.  |
| <code>invalidGaps</code> | Array of Gaps |          | YES        | List of invalid gaps of the reservation. Fetched only if the boolean <code>fetchReservationGaps</code> is set to true |

Each `Gap` object described in `validGaps` or `invalidGaps` array contains the following attributes:

| Attribute                 | Type     | allowsNull | Description  |
|---------------------------|----------|------------|--|
| <code>identifier</code>   | UInt32   | NO         | Planitec internal gap identifier                             |
| <code>startingDate</code> | DateTime | NO         | Genuine gap starting date (without any access control delay) |
| <code>endingDate</code>   | DateTime | NO         | Genuine gap ending date (without any access control delay)   |

Each `ReservationType` object described in `type` relationship contains the following attributes :

| Attribute                     | Type     | Size max | allowsNull | Description                                   |
|-------------------------------|----------|----------|------------|---|
| <code>identifier</code>       | UInt32   |          | NO         | Planitec internal reservation type identifier |
| <code>label</code>            | String   | 100      | NO         | Reservation type name (2 characters min)      |
| <code>code</code>             | String   | 20       | YES        | Reservation type code                         |
| <code>modificationDate</code> | DateTime |          | NO         | Last object modification DateTime stamp       |
| <code>reservations</code>     | Array    |          | NO         | array of Reservation objects with that type   |

Each Activity Object described in `activity` relationship contains the following attributes:

| Attribute                   | Type   | Size max | allowsNull | Description                                |
|-----------------------------|--------|----------|------------|--|
| <code>identifier</code>     | UInt32 |          | NO         | Planitec internal activity identifier      |
| <code>activityTypeID</code> | UInt32 |          | YES        | Planitec internal activity type identifier |
| <code>label</code>          | String | 100      | NO         | Activity name                              |

| Attribute                     | Type     | Size max | allowsNull | Description                             |
|-------------------------------|----------|----------|------------|---|
| <code>modificationDate</code> | DateTime |          | NO         | Last object modification DateTime stamp |
| <code>reservations</code>     | Array    |          | NO         | List of reservations with this activity |

Each People Object described in `contractor` relationship contains the following attributes :

| Attribute                       | Type     | Size max | allowsNull | Description   |
|---------------------------------|----------|----------|------------|---|
| <code>identifier</code>         | UInt32   |          | NO         | Planitec internal user identifier   |
| <code>externalIdentifier</code> | String   | 64       | YES        | External user identifier  |
| <code>label</code>              | String   | 151      | NO         | Complete user name (can be computed)  |
| <code>name</code>               | String   | 100      | NO         | User name (2 character mini)  |
| <code>firstName</code>          | String   | 50       | YES        | User first name   |
| <code>originalName</code>       | String   | 100      | YES        | User maiden name  |
| <code>administrativeCode</code> | String   | 50       | YES        | Person social security number or organization registration number.                            |
| <code>code</code>               | String   | 20       | YES        | User code for internal or external import purpose (was previously <code>internalCode</code> ) |
| <code>modificationDate</code>   | DateTime |          | NO         | Last object modification DateTime stamp   |
| <code>parentsPath</code>        | String   | 512      | YES        | Path of the parents composed by the id of each parent people separated by '/'.                |
| <code>streetNumber</code>       | String   | 10       | YES        |   |
| <code>address1</code>           | String   | 100      | YES        | first line of address   |
| <code>address2</code>           | String   | 100      | YES        | second line of address  |
| <code>zipCode</code>            | String   | 10       | YES        |   |
| <code>city</code>               | String   | 50       | YES        |   |
| <code>tel1</code>               | String   | 20       | YES        | phone number 1  |
| <code>tel2</code>               | String   | 20       | YES        | phone number 2  |
| <code>fax</code>                | String   | 20       | YES        | fax number  |
| <code>email</code>              | String   | 128      | YES        | email   |
| <code>geox</code>               | Float    |          | YES        | x projected localization  |
| <code>geoy</code>               | Float    |          | YES        | y projected localization  |

Release notes V3.6 :

- `fetchReservationGaps` request parameter if set to true indicates what you want potential `validGaps` and `invalidGaps` arrays to be filled for each reservation
- new `validGaps` and `invalidGaps` arrays added in returned `Reservation` objects. Both arrays are ascending sorted by `startingDate` field and then `endingDate` field.
- new `Gap` objects to fill `validGaps` and `invalidGaps` arrays

### Release notes V3.1 :

- the returned attribute `situation` did replace the `reservationStatus` field described in V3 and is now a full unsigned value with 0 = invalid, 1 = pre-reservation, 2 = standard reservation and 3 = confirmed reservation.

## createPerson [new request in V3]

This requests allow the current operator to create new person who can be reservation contractors.

### Request parameters :

The requested parameters for this request are described in the following table :

| Parameter  | Type             | Mandatory | Size max    | Description   |
|--|------------------|-----------|-------------|---|
| <code>externaUserIdentifier</code>                   | String           | YES       | 64          | The operator's external unique identifier. This identifier cannot change after the person creation. |
| <code>name</code>                                    | String           | YES       | 100         | Person name. Should contains at least 2 characters  |
| <code>firstName</code>                               | String           | NO        | 50          | Person first name   |
| <code>code</code>                                    | String           | NO        | 20          | Person administrative code  |
| <code>email</code>                                   | String           | NO        | 128         | Person email  |
| <code>civilityCode</code> OR <code>civilityID</code> | String OR UInt32 | NO        | 20 (string) | Person civility code (juridic type internal code) or person civility ID.                            |
| <code>pricingCode</code> OR <code>pricingID</code>   | String OR UInt32 | NO        | 20 (string) | Person pricing category code (internalCode) or pricing category's Planitec ID.                      |
| <code>streetNumber</code>                            | String           | NO        | 10          | address street number   |
| <code>address1</code>                                | String           | NO        | 100         | address line 1  |
| <code>address2</code>                                | String           | NO        | 100         | address line 2  |
| <code>zipCode</code>                                 | String           | NO        | 10          | address zip code  |
| <code>city</code>                                    | String           | NO        | 50          | address city  |
| <code>tell1</code>                                   | String           | NO        | 20          | phone 1   |

| Parameter  | Type                  | Mandatory | Size max | Description   |
|------------|-----------------------|-----------|----------|---|
| tel2       | String                | NO        | 20       | phone 2   |
| fax        | String                | NO        | 20       | fax   |
| extensions | Array of Dictionaries | NO        |          | The <code>extensions</code> array should contains a list of dictionaries containing 3 mandatory fields : <code>name</code> , <code>type</code> and <code>value</code> . |

A template of an `extensions` array containing only one extension to be added to the newly created person :

```
extensions = (
  {
    name = "EXTENSION_NAME" ; // mandatory planitec extension name
    type = "aType" ; // mandatory planitec extension type ("string", "int",
      // "unsigned", "float", "bool", "date" or "color")
    value= aValue ; // can be a String, a Date, a MSTC color object...
  }
)
```

Request output :

```
externalUserIdentifier = "aString" ; // the given external identifier
userIdentifier = aNumber ; // Planitech internal UInt32 people identifier
creationStatus = "aString" ; // "OK" or "DUPLICATE" if the user did already
// exists and cannot be created twice OR
"BADCIVILITY"
// if the civility code is wrong OR
"BADPRICECATEGORY"
// if the pricing category is wrong.
```

A `BADCIVILITY` value in `creationStatus` means that the person is created but it's civility is not set.

Release notes V3.6 :

- `extensions` request parameter permits to add any extension to the any created reservation.

Release notes V3.4 :

- the request field `pricingCode` and `pricingID` as been added. Both keys cannot be used at the same time

Release notes V3.1 :

- the request field `civilityID` has been added to the request. It could be used instead of `civilityCode`. Both keys cannot be used at the same time

## updatePerson [new request in V3]

This request allows the current operator to update a person's information.

Request parameters :

The request parameters for this request are nearly the same as the `createPerson` request (including `extensions`). You just can tell which person you want to modify by using its Planitec internal `uint32` `userIdentifier` instead of the `externalUserIdentifier`. Both request attributes cannot be used at the same time.

With this request you never can remove the civility of a person. You can change it though by using a new `civilityCode`.

Request output :

```
modificationStatus = "aString" ; // "OK" or "BADCIVILITY" or "NOTFOUND" or NOP
```

`BADCIVILITY` means that the given civility code is wrong. All fields but this one are modified.

`NOTFOUND` means we have not found the person meant to be changed.

`NOP` means nothing was changed (you didn't change the content of the given person by your call)

Release notes V3.6 :

- `extensions` request parameter permits to add or modify any extension to any person. Warning: you cannot formally remove an extension value with the current api, the only way is to set an empty string value to the extension you want to remove.

Release notes V3.1 :

- the dictionary `modifications` does not exist any more in the request. Instead, all modified fields are directly set in the request.

## getFutureReservationPrice [new request in V3.4]

This request allows the current operator to calculate the price of a future new reservation made on a bunch of resources where one of them (and strictly one only) can induce an automatic pricing of the reservation. Using this API, no reservation is created. There's only a without VAT price calculation if possible.

Request parameters :

The requested parameters for this request are described in the following table :

| Parameter  | Type             | Mandatory                          | Size max    | Description   |
|--|------------------|------------------------------------|-------------|---|
| <code>contractorID</code> or <code>contractorExternalIdentifier</code> | UInt32 or string | YES                                | 64 (string) | planitec ID or external identifier of the reservation contractor                              |
| <code>activityID</code> or <code>activityCode</code>                   | UInt32 or string | YES                                | 64 (string) | Planitec ID or internalCode of the reservation activity                                       |
| <code>typeID</code> or <code>typeCode</code>                           | UInt32 or string | NO                                 | 64 (string) | Planitec ID or internalCode of the reservation type   |
| <code>isWeekly</code>  | Boolean          | YES                                |             | The reservation has a single gap or multiple gaps based on a weekly period type.              |
| <code>start</code>   | Date             | YES                                |             | Reservation starting date   |
| <code>end</code>   | Date             | YES                                |             | Reservation ending date   |
| <code>places</code>  | Array            | YES                                |             | Array of Planitec's place identifiers   |
| <code>gapStart</code>  | UInt32           | YES if weekly.<br>Absent otherwise | 1435        | starting gaps time (minutes)  |
| <code>gapEnd</code>  | UInt32           | YES if weekly.<br>Absent otherwise | 1440        | ending gaps time (minutes)  |
| <code>days</code>  | Natural Array    | YES if weekly.<br>Absent otherwise | 7 numbers   | List of days we enforce the reservations (0 to 6).  |
| <code>takesDownValue</code>  | Boolean          | NO (considered as NO if absent)    |             | If set to YES, the price calculation is made in client's favor if there's a choice to be made |

## Request output :

```
calculatedPrice = aMoneyNumber ; // a UInt32 price in 1/1000 of currency unit
calculationStatus = "aString" ; "OK" or "INVALID" or "NOPRICE" or "KO"
```

## createReservation [new request in V3]

This requests allow the current operator to create new reservations. The reservation is created with a INET status and as pre-reservations (situation code 1)

Request parameters :

The requested parameters for this request are described in the following table :

| Parameter  | Type             | Mandatory                           | Size max      | Description  |
|--|------------------|-------------------------------------|---------------|--|
| <code>object</code>  | String           | NO                                  | 100           | Short description of the reservation. If not set, the contractor's name is used.                           |
| <code>contractorID</code> or <code>contractorExternalIdentifier</code> | UInt32 or string | YES                                 | 64 (string)   | planitec ID or external identifier of the reservation contractor   |
| <code>requesterID</code> or <code>requesterExternalIdentifier</code>   | UInt32 or string | NO                                  | 64 (string)   | planitec ID or external identifier of the reservation requester  |
| <code>activityID</code> or <code>activityCode</code>                   | UInt32 or string | YES                                 | 64 (string)   | Planitec ID or internalCode of the reservation activity  |
| <code>typeID</code> or <code>typeCode</code>                           | UInt32 or string | NO                                  | 64 (string)   | Planitec ID or internalCode of the reservation type  |
| <code>code</code>  | String           | NO                                  | 20            | Reservation internal code  |
| <code>price</code>   | UInt32           | NO. Absent if weekly is set to YES. | 60% of MaxInt | Reservation price in 1/1000 of unit. If set, the reservation price is set with no calculation by Planitec. |
| <code>vatRate</code>   | UInt32           | NO. Absent if weekly is set to YES. | 4000          | VAT rate in 1/10000.   |
| <code>isWeekly</code>  | Boolean          | YES                                 |               | The reservation has a single gap or multiple gaps based on a weekly period type.                           |
| <code>start</code>   | Date             | YES                                 |               | Reservation starting date  |
| <code>end</code>   | Date             | YES                                 |               | Reservation ending date  |

| Parameter                | Type                  | Mandatory                          | Size max  | Description   |
|--------------------------|-----------------------|------------------------------------|-----------|---|
| <code>places</code>      | Array                 | YES                                |           | Array of Planitec's place identifiers   |
| <code>gapStart</code>    | UInt32                | YES if weekly.<br>Absent otherwise | 1435      | starting gaps time (minutes)  |
| <code>gapEnd</code>      | UInt32                | YES if weekly.<br>Absent otherwise | 1440      | ending gaps time (minutes)  |
| <code>days</code>        | Natural Array         | YES if weekly.<br>Absent otherwise | 7 numbers | List of days we enforce the reservations (0 to 6).  |
| <code>noConflicts</code> | Boolean               | NO (considered as NO if absent)    |           | If set to YES, the reservation cannot be created if there's any conflict with any other reservations  |
| <code>commentary</code>  | String                | NO                                 |           | optional commentary for the created reservation. This string value is stored in the <code>COMMENTARY</code> reservation extension                                       |
| <code>extensions</code>  | Array of Dictionaries | NO                                 |           | The <code>extensions</code> array should contains a list of dictionaries containing 3 mandatory fields : <code>name</code> , <code>type</code> and <code>value</code> . |

A template of an `extensions` array containing only one extension to be added to the newly created reservation :

```

extensions = (
  {
    name = "EXTENSION_NAME" ; // mandatory planitec extension name
    type = "aType" ; // mandatory planitec extension type ("string", "int",
      // "unsigned", "float", "bool", "date" or "color")
    value = aValue ; // can be a String, a Date, a MSTE color object...
  }
)

```

## Request output :

```
reservationIdentifier = aNumber ; // Planitech internal UInt32 reservation
creationStatus = "aString" ; "OK" or "INVALID" or "BADTYPE" or "KO" or "CONFLICTS"
```

The returned `creationStatus` are :

| <b>creationStatus</b> | <b>Description</b>   |
|-----------------------|--|
| <b>OK</b>             | The reservation was correctly created and all the informations you put in were accepted.   |
| <b>BADTYPE</b>        | The reservation was correctly created and the information but the reservation type were accepted.  |
| <b>INVALID</b>        | This code is returned only if you put <code>noConflicts</code> parameter to <b>YES</b> and the reservation you tried to create appeared to be in conflict. In that case the created <code>reservationIdentifier</code> is returned but the created reservation is saved in Planitec Database with an <code>invalid</code> status.  |
| <b>CONFLICTS</b>      | This code is returned only if you put <code>noConflicts</code> parameter to <b>YES</b> and the reservation you tried to create appeared to be in conflict and for some internal reason the web service could not register the new created reservation as invalid. In that case the created <code>reservationIdentifier</code> is returned and it's up to the web service to later change that reservation status to invalid. |
| <b>KO</b>             | The reservation could not be created at all.   |

## Release notes V3.6 :

- `extensions` request parameter permits to add any extension to the any created reservation.

## Release notes V3.5 :

- `commentary` request parameter permits to add a commentary to any created reservation.

## Release notes V3.3 :

- A request field `noConflicts` has been added.

## Release notes V3 :

- the request field `contractorExternalIdentifier` has been added to the request. It could be used instead of `contractorID`. Both keys cannot be used at the same time.
- the request field `requesterExternalIdentifier` has been added to the request. It could be used instead of `requesterID`. Both keys cannot be used at the same time.
- the request field `activityCode` has been added to the request. It could be used instead of `activityID`. Both keys cannot be used at the same time.

- the request fields `typeID` and `typeCode` have been added to the request. Their role is to set the future reservation type. Both keys cannot be used at the same time.
- the request field `isWeeklyReservation` has been replaced by the field `isWeekly`.
- the request field `startingDate` has been replaced by the field `start`.
- the request field `endingDate` has been replaced by the field `end`.
- the request field `startingGapsHour` has been replaced by the field `gapStart`.
- the request field `endingGapsHour` has been replaced by the field `gapEnd`.
- the request field `reservationDays` has been replaced by the field `days`.

## updateReservation [new request in V3.1]

This requests allow the current operator to update a reservation status. It replaces the `updateReservationStatus` request which appeared in V3.

Request parameters :

```
reservationIdentifier = aNumber ; // Planitech internal UInt32 reservation ID
situation = aNumber ; // 0 to 3 (description bellow)
typeID = aNumber or typeCode = "aString" ; // you can change the reservation type
object = aString ; // you can change the reservation object
code = aString ; // you can change the reservation internal code
commentary = aString ; // you can change the reservation commentary
extensions = anArray ; // array of extensions to be modified (see
createReservation to see the extensions array description)
```

Each status cannot be set at all times. Here is the status evolution table

| Original situation  | Authorized situation change               |
|---------------------|---|
| 1 = pre-reservation | 0 = invalid, 2 = standard, 3 = confirmed, |
| 2 = standard        | 0 = invalid, 3 = confirmed                |
| 3 = confirmed       | 0 = invalid                               |
| 0 = invalid         | NONE                                      |

Following this rules, this web service cannot revalidate any invalidated reservation.

Request output :

```
modificationStatus = "aString" ; // "OK", "BADTYPE", "NOTFOUND" or "NOP"
```

A **BADTYPE** value in **modificationStatus** means that the new reservation type was not found and so the actual reservation type remains valid.

A **NOTFOUND** value in **modificationStatus** means the system didn't find the searched reservation.

A **NOP** value in **modificationStatus** means that the modifications you attempted to make didn't change the actual reservation. Beware, if you request only for a type change and if the new type is not found, the final error would be **NOP** and not **BADTYPE** because nothing did change.

#### Release notes V3.6 :

- **extensions** request parameter permits to add or modify any extension to the any reservation.  
Warning: you cannot formally remove an extension value with the current api, the only way is to set an empty string value to the extension you want to remove.

#### Release notes V3.5 :

- **commentary** request parameter permits to modify commentary to any reservation

## addReservationDocument [new request in V3]

This requests allow the current operator to attach a new document to an existing reservation.

#### Request parameters :

```
reservationIdentifier = aNumber ; // Planitech internal UInt32 reservation ID
.../... // document description fields (see below)
documentContent = aDataStram ; // an MSTE Data with the document content
```

The **document** descriptions fields are :

| Attribute          | Type             | Mandatory | Size max    | Description  |
|--------------------|------------------|-----------|-------------|--|
| label              | String           | NO        | 100         | Document label (if not set uses part of fileName)  |
| fileName           | String           | YES       | 100         | Document file name (not a path, only the file name with its extension, e.g. "MyPassport.pdf"). Having an extension is mandatory. |
| code               | String           | NO        | 20          | Document internal code   |
| typeID or typeCode | UInt32 or String | NO        | 20 (String) | Document type Planitec identifier (number) or document type code (should match a real document type internal code).              |
| validityStart      | Date             | NO        |             | Date object for starting validity  |

| Attribute   | Type | Mandatory | Size max | Description  |
|-------------|------|-----------|----------|--|
| validityEnd | Date | NO        |          | Date object for ending validity  |
| issueDate   | Date | NO        |          | Date object. The date of issue of the document (e.g. the issue date of you driver licence) |

Request output :

```
reservationDocumentIdentifier = aNumber ; // planitec ID of the created document
creationStatus = "OK" or "NOTFOUND" ; // NOTFOUND if the reservation is not found
```

Release notes V3.1 :

- added request field `issueDate`.
- the request field `name` has been replaced by `label`.
- the `document` dictionary has been replaced by its fields in the request.
- the request field `typeID` has been added to the request. It has the same role as `typeCode` field. Their role is to set the future document reservation type. Both keys cannot be used at the same time.
- Less creationStatus as request output. Everything should be OK for the document to be created and when it's created, the `reservationDocumentIdentifier` is returned.
- The maximal transmission size is **10MB** while Base64 encoded with request extra informations which means your document should not be heavier than **7MB**.

## getGaps

This requests allow the current operator to retrieve planning gaps with all associated informations.

- 

Request parameters :

The requested parameters for this request are described in the following table :

| Parameter                     | Type            | Mandatory | Description   |
|-------------------------------|-----------------|-----------|---|
| <code>start</code>            | DateTime        | YES       | Precise date from when we want to fetch gaps                  |
| <code>end</code>              | DateTime        | YES       | Precise date to when we want to fetch gaps                    |
| <code>placeIdentifiers</code> | Array of UInt32 | NO        | List of Planitec's place IDs from where we want to fetch gaps |

| Parameter                        | Type                                  | Mandatory | Description  |
|----------------------------------|---------------------------------------|-----------|--|
| <code>userIdentifiers</code>     | Array of UInt32 or String Identifiers | NO        | List of Planitec's user IDs or externalIdentifiers (you can mix) to define the contractors from whom we want to fetch gaps   |
| <code>activityIdentifiers</code> | Array or UInt32                       | NO        | List of Planitec activity IDs to define the activities from which we want to fetch gaps  |
| <code>ignoreAccessDelays</code>  | Boolean                               | NO        | If set to true, returned gaps are genuine : they don't include the delays coming from access control systems (i.e. the reservation extensions <code>DEL_OUV</code> and <code>DEL_FERM</code> which add minutes to each gaps of the reservation if this parameter is not set) |

### Request output :

```
gaps = (...) ; // an array of gaps matching the request
closureGaps = ( ... ) ; // an array of closure gaps matching the request
allPlaces = ( ... ) ; // all places fetched for fetched gaps
allUsers = ( ... ) ; // all contractor users fetched for fetched gaps
allTriggers = ( ... ) ; // all triggers fetched for fetched gaps
allBadges = ( ... ) ; // all badges fetched for fetched gaps
allBadgeTypes = ( ... ) ; // all badges types fetched for fetched gaps
allActivities = ( ... ) ; // all activities fetched for fetched gaps
requestedPlaces = ( ... ) ; // all requested places
requestedUsers = ( ... ) ; // all requested users
requestedActivities = ( ... ) ; // all requested activities
rootPlaces = ( ... ) ; // extract root places from all fetched places
rootUsers = ( ... ) ; // root users from all fetched users
```

All gaps returned by the request have the following attributes:

| Attribute                     | Type     | Size max | allowsNull | Description   |
|-------------------------------|----------|----------|------------|---|
| <code>identifier</code>       | UInt32   |          | NO         | Planitec's gap unique identifier                                  |
| <code>label</code>            | String   | 100      | NO         | Reservation label   |
| <code>reservationID</code>    | UInt32   |          | NO         | Planitec's reservation unique identifier                          |
| <code>modificationDate</code> | DateTime |          | NO         | Last modification date  |
| <code>startingDate</code>     | DateTime |          | NO         | gap start   |
| <code>endingDate</code>       | DateTime |          | NO         | gap end   |
| <code>isClosure</code>        | Boolean  |          | YES        | if set and the value is YES, the gap is a closure reservation gap |

| Attribute                 | Type                     | Size max | allowsNull | Description   |
|---------------------------|--------------------------|----------|------------|---|
| <code>openingMode</code>  | UInt32                   | 12       | YES        | value can be 2 = « Badgege », 11 = « Free », 12 = « Libre après premier badgege ». DEPRECATED. SHOULD SOON BE REPLACED BY FETCHING EXTENSIONS |
| <code>openingTimer</code> | UInt32                   |          | YES        | DEPRECATED. SHOULD SOON BE REPLACED BY FETCHING EXTENSIONS  |
| <code>closingTimer</code> | UInt32                   |          | YES        | DEPRECATED. SHOULD SOON BE REPLACED BY FETCHING EXTENSIONS  |
| <code>activity</code>     | Activity object          |          | NO         | reservation Activity Object   |
| <code>contractor</code>   | User object              |          | NO         | reservation contractor User Object  |
| <code>users</code>        | Array of User objects    |          | YES        | array of users who have badges for this gap   |
| <code>places</code>       | Array of Place objects   |          | NO         | array of places reserved with this gap  |
| <code>badges</code>       | Array of Badge objects   |          | YES        | array of badges available for this gap  |
| <code>triggers</code>     | Array of Trigger objects |          | YES        | array of triggers available for this gap  |

Each `User` Object described in returned request relationships contains the following attributes:

| Attribute                       | Type   | Size max | allowsNull | Description                          |
|---------------------------------|--------|----------|------------|--------------------------------------|
| <code>identifier</code>         | UInt32 |          | NO         | Planitec internal user identifier    |
| <code>externalIdentifier</code> | String | 64       | YES        | External user identifier             |
| <code>label</code>              | String | 151      | NO         | Complete user name (can be computed) |
| <code>name</code>               | String | 100      | NO         | User name (2 character mini)         |
| <code>firstName</code>          | String | 50       | YES        | User first name                      |
| <code>originalName</code>       | String | 100      | YES        | User maiden name                     |

| Attribute                       | Type     | Size max | allowsNull | Description  |
|---------------------------------|----------|----------|------------|--|
| <code>administrativeCode</code> | String   | 50       | YES        | Person social security number or association, organism or company registration number.             |
| <code>code</code>               | String   | 20       | YES        | User code for internal or external import purpose (was previously <code>internalCode</code> )      |
| <code>modificationDate</code>   | DateTime |          | NO         | Last object modification DateTime stamp  |
| <code>parentsPath</code>        | String   | 512      | YES        | Path of the parents composed by the id of each parent people separated by '/' (eg: "1/2/3").       |
| <code>streetNumber</code>       | String   | 10       | YES        |  |
| <code>address1</code>           | String   | 100      | YES        | first line of address  |
| <code>address2</code>           | String   | 100      | YES        | second line of address   |
| <code>zipCode</code>            | String   | 10       | YES        |  |
| <code>city</code>               | String   | 50       | YES        |  |
| <code>tel1</code>               | String   | 20       | YES        | phone number 1   |
| <code>tel2</code>               | String   | 20       | YES        | phone number 2   |
| <code>fax</code>                | String   | 20       | YES        | fax number   |
| <code>email</code>              | String   | 128      | YES        | email  |
| <code>geox</code>               | Float    |          | YES        | x projected localization   |
| <code>geoy</code>               | Float    |          | YES        | y projected localization   |
| <code>parentUser</code>         | Object   |          | YES        | parent User object   |
| <code>children</code>           | Array    |          | YES        | array of children objects (array of User objects)  |
| <code>type</code>               | Object   |          | YES        | type object of the user (a UserType object)  |
| <code>juridicType</code>        | Object   |          | YES        | juridic type object of the user (a UserType object). The juridic type of a person is its civility. |
| <code>badges</code>             | Array    |          | YES        | array of Badge objects possessed by the user   |
| <code>gaps</code>               | Array    |          | NO         | Gaps where the user appears as contractor or employee or possessor of a badge                      |

Each `Place` Object described in returned request relationships contains the following attributes:

| Attribute | Type | Size max | allowsNull | Description |
|-----------|------|----------|------------|-------------|
|-----------|------|----------|------------|-------------|

| Attribute                       | Type     | Size max | allowsNull | Description  |
|---------------------------------|----------|----------|------------|--|
| <code>identifier</code>         | UInt32   |          | NO         | Planitec internal place identifier   |
| <code>resourceIdentifier</code> | UInt32   |          | NO         | Planitec internal place's twin resource identifier   |
| <code>label</code>              | String   | 100      | NO         | User name (2 character mini)   |
| <code>code</code>               | String   | 20       | YES        | Place code for internal or external import purpose (was previously <code>internalCode</code> ) |
| <code>modificationDate</code>   | DateTime |          | NO         | Last object modification DateTime stamp  |
| <code>parentsPath</code>        | String   | 512      | YES        | Path of the parents composed by the id of each parent place separated by '/' (eg: "1/2/3").    |
| <code>streetNumber</code>       | String   | 10       | YES        |  |
| <code>address1</code>           | String   | 100      | YES        | first line of address  |
| <code>address2</code>           | String   | 100      | YES        | second line of address   |
| <code>zipCode</code>            | String   | 10       | YES        |  |
| <code>city</code>               | String   | 50       | YES        |  |
| <code>tel1</code>               | String   | 20       | YES        | phone number 1   |
| <code>tel2</code>               | String   | 20       | YES        | phone number 2   |
| <code>fax</code>                | String   | 20       | YES        | fax number   |
| <code>email</code>              | String   | 128      | YES        | email  |
| <code>geox</code>               | Float    |          | YES        | x projected localization   |
| <code>geoy</code>               | Float    |          | YES        | y projected localization   |
| <code>provisionTime</code>      | Int32    |          | YES        | default time necessary for setting up the place  |
| <code>returnTime</code>         | Int32    |          | YES        | default time necessary to clean the place  |
| <code>parentPlace</code>        | Object   |          | YES        | parent Place object  |
| <code>children</code>           | Array    |          | YES        | array of children objects (array of Place objects)   |
| <code>triggers</code>           | Array    |          | YES        | array of Trigger objects attached to the Place object  |
| <code>gaps</code>               | Array    |          | YES        | array of Gaps objects which contain the place as reserved resource                             |

| Attribute                | Type  | Size max | allowsNull | Description  |
|--------------------------|-------|----------|------------|--|
| <code>closureGaps</code> | Array |          | YES        | array of Gaps objects which contain the place as closure |

One of the array `gaps` or `closureGaps` should be set.

Each **Activity** Object described in returned request relationships contains the following attributes:

| Attribute                     | Type     | Size max | allowsNull | Description                                |
|-------------------------------|----------|----------|------------|--|
| <code>identifier</code>       | UInt32   |          | NO         | Planitec internal activity identifier      |
| <code>activityTypeID</code>   | UInt32   |          | YES        | Planitec internal activity type identifier |
| <code>label</code>            | String   | 100      | NO         | Activity name                              |
| <code>modificationDate</code> | DateTime |          | NO         | Last object modification DateTime stamp    |
| <code>gaps</code>             | Array    |          | NO         | Gaps where the activity is practiced       |

Each **Badge Object** described in returned request relationships contains the following attributes:

| Attribute                     | Type     | Size max | allowsNull | Description   |
|-------------------------------|----------|----------|------------|---|
| <code>identifier</code>       | UInt32   |          | NO         | Planitec internal badge identifier  |
| <code>number</code>           | UInt32   |          | NO         | Badge number.   |
| <code>serialNumber</code>     | String   | 100      | NO         | badge serial number   |
| <code>label</code>            | String   | 30       | NO         | Generally a less than 30 characters string composed by the technology code (20 characters max) and the badge number (10 decimal digits max) |
| <code>ownerName</code>        | String   | 151      | NO         | Owner complete name. Obsolete as <i>redundant information with user.label. Should disappear in future versions.</i>                         |
| <code>isMasterBadge</code>    | Boolean  |          | YES        | absence is equivalent to the NO value   |
| <code>modificationDate</code> | DateTime |          | NO         | Last object modification DateTime stamp   |
| <code>user</code>             | Object   |          | NO         | the User object this badge belongs to   |
| <code>type</code>             | Object   |          | YES        | The badge's type as a BadgeType object.   |
| <code>gaps</code>             | Array    |          | NO         | Gaps where the current badge is used.   |

Each **BadgeType** Object described in returned request relationships contains the following attributes:

| Attribute                     | Type     | Size max | allowsNull | Description                                      |
|-------------------------------|----------|----------|------------|--|
| <code>identifier</code>       | UInt32   |          | NO         | Planitec internal badge type identifier          |
| <code>label</code>            | String   | 100      | NO         | Badge type (technology) name (2 characters mini) |
| <code>code</code>             | String   | 20       | YES        | Badge technology code name                       |
| <code>modificationDate</code> | DateTime |          | NO         | Last object modification DateTime stamp          |
| <code>badges</code>           | Array    |          | NO         | array of Badges objects which have that type     |

Each `Trigger` Object described in returned request relationships contains the following attributes:

| Attribute                     | Type     | Size max | allowsNull | Description                             |
|-------------------------------|----------|----------|------------|---|
| <code>identifier</code>       | UInt32   |          | NO         | Planitec internal trigger identifier    |
| <code>label</code>            | String   | 100      | NO         | Trigger name                            |
| <code>modificationDate</code> | DateTime |          | NO         | Last object modification DateTime stamp |
| <code>places</code>           | Array    |          | NO         | All places where this trigger appears   |
| <code>gaps</code>             | Array    |          | NO         | All gaps where this trigger appears     |

Release notes V3 :

- the request field `startingDate` has been replaced by `start`.
- the request field `endingDate` has been replaced by `end`.
- the request field `places` has been replaced by `placeIdentifiers`.
- the request field `users` has been replaced by `userIdentifiers`.
- the request field `activities` has been replaced by `activityIdentifiers`.
- The array `closureGaps` in Place objects is now working. Before, `gaps` relationship was wrongly used
- A relationship `contractor` did appear in Gap objects. Before there was only the `users` relationship.

## getFreeGaps

This requests allow the current operator to verify the availability of a given list of places.

- 

Request parameters :

This request must have 3 mandatory parameters :

```
placeIdentifiers = ( ... ) ; // an array of targeted place identifiers
startingDate = aDate ; // starting date for searching
endingDate = aDate ; // ending date for searching
```

Then, we can specify a searched duration within a range of time :

```
requestedDuration = aNumber ; // searched duration in minutes
startingTime = aNumber ; // starting time in minutes for searching
endingTime = aNumber ; // ending time in minutes for searching
```

Or you can directly specify a searched gap in the given dates :

```
requestedStartingTime = aNumber ; // gap starting time in minutes for searching
requestedEndingTime = aNumber ; // gap ending time in minutes for searching
```

In both case, you can optionally specify the searched days :

```
reservationDays = ( ... ) ; // a array of searched days (0 = Sun, ... 6 = Sat)
```

Request output :

```
availablePlaces = ( ... ) ; // an array of places with free gaps (description below)
```

Each **Place** in **availablePlaces** contains the following attributes:

| Attribute                 | Type   | Size max | allowsNull | Description   |
|---------------------------|--------|----------|------------|---|
| <b>placeIdentifier</b>    | UInt32 |          | NO         | The place internal identifier                                 |
| <b>resourceIdentifier</b> | UInt32 |          | NO         | The place twin resource internal identifier                   |
| <b>label</b>              | String | 100      | NO         | The place name  |
| <b>freeGaps</b>           | Array  |          | NO         | All gaps available for the given place in the requested range |

Each free **Gap** in **freeGaps** is a **MSTE Couple** object with the starting availability as a **Date** object in its **firstMember** and the ending availability as a **Date** object in its **secondMember**.

Release notes V3 :

- the attribute **placeID** in returned Place objects as been replaced by **placeIdentifier**.

- the attribute `resourceID` in returned Place objects as been replaced by `resourceIdentifier`.
- the attribute `resourceName` in returned Place objects as been replaced by `label`.

## getCivilities [new request in V3.2]

This requests allow the current operator to all civilities registered in the database.

Request parameters :

NONE

Request output :

```
civilities = ( ... ) ; // an array of Civility objects
```

Each `Civility` object contains the following attributes

| Attribute        | Type     | Size Max | allowsNull | Description                  |
|------------------|----------|----------|------------|------------------------------|
| label            | String   | 100      | NO         | Civility name                |
| identifier       | UInt32   |          | NO         | Planitec internal identifier |
| code             | String   | 20       | YES        | Internal code                |
| modificationDate | DateTime |          | NO         | Last modification date       |

## getActivities [new request in V3.2, modified in 3.3.1]

This requests allow the current operator to retrieve all standard activities registered in the database.

Request parameters :

NONE

Request output :

```
activities = ( ... ) ; // an array of Activity objects
```

Each `Activity` object contains the following attributes

| Attribute      | Type   | Size Max | allowsNull | Description                                |
|----------------|--------|----------|------------|--|
| label          | String | 100      | NO         | Activity name                              |
| identifier     | UInt32 |          | NO         | Planitec internal identifier               |
| activityTypeID | UInt32 |          | YES        | Planitec internal activity type identifier |

| Attribute        | Type     | Size Max | allowsNull | Description            |
|------------------|----------|----------|------------|------------------------|
| code             | String   | 20       | YES        | Internal code          |
| modificationDate | DateTime |          | NO         | Last modification date |

## getActivityTypes [new request in V3.3.1]

This requests allow the current operator to all standard activity types registered in the database.

Request parameters :

NONE

Request output :

```
types = ( ... ) ; // an array of ActivityType objects
```

Each **ActivityType** object contains the following attributes

| Attribute        | Type     | Size Max | allowsNull | Description                  |
|------------------|----------|----------|------------|------------------------------|
| label            | String   | 100      | NO         | Activity type name           |
| identifier       | UInt32   |          | NO         | Planitec internal identifier |
| code             | String   | 20       | YES        | Internal code                |
| modificationDate | DateTime |          | NO         | Last modification date       |

## getDocumentTypes [new request in V3.2]

This requests allow the current operator to all document types registered in the database.

Request parameters :

NONE

Request output :

```
types = ( ... ) ; // an array of DocumentType objects
```

Each **DocumentType** object contains the following attributes

| Attribute  | Type   | Size Max | allowsNull | Description                  |
|------------|--------|----------|------------|------------------------------|
| label      | String | 100      | NO         | Document type name           |
| identifier | UInt32 |          | NO         | Planitec internal identifier |

| Attribute        | Type     | Size Max | allowsNull | Description            |
|------------------|----------|----------|------------|------------------------|
| code             | String   | 20       | YES        | Internal code          |
| modificationDate | DateTime |          | NO         | Last modification date |

## getReservationTypes [new request in V3.2]

This requests allow the current operator to all reservation types registered in the database.

Request parameters :

NONE

Request output :

```
types = ( ... ) ; // an array of ReservationType objects
```

Each `ReservationType` object contains the following attributes

| Attribute        | Type     | Size Max | allowsNull | Description                  |
|------------------|----------|----------|------------|------------------------------|
| label            | String   | 100      | NO         | Reservation type name        |
| identifier       | UInt32   |          | NO         | Planitec internal identifier |
| code             | String   | 20       | YES        | Internal code                |
| modificationDate | DateTime |          | NO         | Last modification date       |

## logEvents

This requests allow the current operator to log events coming from its own system to Planitec database.

- 

Request parameters :

This request only contains an array of events :

```
events = ( ... ) ; // an array of events to be inserted in log events database
```

The event array is filled with objects containing the following attributes :

| Attribute                       | Type   | Mandatory | Size max | Description               |
|---------------------------------|--------|-----------|----------|---------------------------|
| <code>externalIdentifier</code> | String | NO        | 40       | Event external identifier |

| Attribute   | Type                | Mandatory | Size max       | Description  |
|---|---------------------|-----------|----------------|--|
| <code>eventDate</code>  | DateTime            | YES       |                | Event date   |
| <code>eventDescription</code>   | String              | YES       | 1000           | Event description  |
| <code>badgeIdentifier</code> or<br><code>badgeLabel</code>            | UInt32 or<br>String | NO        | 30<br>(string) | Badge used during the event. The badge is found either with its Planitec's unique identifier or with its Label                                     |
| <code>level</code>  | UInt32              | NO        | 0, 1 or<br>2   | 0 = standard, 1 = alarm, 2 = error   |
| <code>type</code>   | String              | YES       | 255            | Name of the event  |
| <code>placeIdentifier</code>  | UInt32              | NO        |                | Planitec Place internal identifier.<br>Place where the event occurred  |
| <code>triggerIdentifier</code>  | UInt32              | NO        |                | Planitec Trigger internal identifier.<br>Trigger which was fired during the event  |
| <code>userIdentifier</code> or<br><code>userExternalIdentifier</code> | UInt32 or<br>String | NO        | 64<br>(string) | User connected to this event. The user is described with its Planitec internal identifier (an unsigned) or with its external identifier (a string) |

### Request output :

This request has no output.

### Release notes V3.1 :

- the request field `externalIdentifier` did replace the field `eventID`.
- the request field `eventDescription` did replace the field `desc`.
- the request field `badgeIdentifier` did replace the field `badgeID`.
- the request field `placeIdentifier` did replace the field `placeID`.
- the request field `userIdentifier` did replace the field `userID`.
- the request field `triggerIdentifier` did replace the field `triggerID`.
- the request field `userExternalIdentifier` could be used instead of `userIdentifier`. Both fields cannot be used at the same time.

\$\$ WARNING : THIS REQUEST IS IN EVOLUTION PROCESS. KEEP USING V2. \$\$

## Annexe Spec MSTE

## Objectifs:

- facilité de transport:
  - chaîne de caractères avec possibilité d'escaper tout caractère Unicode tout en permettant l'utilisation native de l'UTF8 ;
  - sous-ensemble de la norme JSON: tableau de valeurs (chaines et nombres)
- support des classes personnalisés
- support des cycles

## Version 1.\*

Les versions 1.0.\* ont pour différences avec la version 2:

- non streamable à l'encodage, il est nécessaire d'avoir toute la chaîne pour finir l'encodage (CRC, classes et clés)
- utilisation d'un CRC (qui dans la pratique est bien souvent ignoré)
- encodage des références uniquement

La version 1.0.2 réorganise les codes des tokens et simplifie les références.

Format de la chaîne MSTE:

```
+-----+-----+-----+-----+-----+-----+
| Version MSTE | Nombre de tokens | CRC | Classes | Clés | Objet racine |
+-----+-----+-----+-----+-----+-----+
```

- Version MSTE: MSTE0101 / MSTE0102
- Nombre de tokens: le nombre de tokens total (cela comprends Version MSTE et Nombre de tokens)
- CRC: Le CRC de la chaîne final calculé en définissant le token CRC à CRC00000000
- Classes: le nombre de classes suivi des classes
- Clés: le nombre clés suivi des clés

## Tokens MSTE0102

| Type               | Code  | Suite attendue | Ref |
|--------------------|-------|----------------|-----|
| Objet null         | 0     | Aucune         | Non |
| Valeur "vraie"     | 1     | Aucune         | Non |
| Valeur "fausse"    | 2     | Aucune         | Non |
| Chaîne vide        | 3     | Aucune         | Non |
| Data vide          | 4     | Aucune         | Non |
| <i>inutilisées</i> | 5 - 8 |                |     |

| Type                 | Code       | Suite attendue   | Ref |
|----------------------|------------|--|-----|
| Référence            | 9          | 1 token contenant l'index dans le tableau des objets déjà décodés de l'objet à utiliser comme référence.   | Non |
| int8                 | 10         | un nombre compris entre -128 et +127   | Non |
| uint8                | 11         | un nombre compris entre 0 et 255   | Non |
| int16                | 12         | un nombre compris entre -32768 et +32767   | Non |
| uint16               | 13         | un nombre compris entre 0 et 65535   | Non |
| int32                | 14         | un nombre compris entre $-(2^{31})$ et $(2^{31})-1$  | Non |
| uint32               | 15         | un nombre compris entre 0 et $(2^{32})-1$  | Non |
| int64                | 16         | un nombre compris entre $-(2^{63})$ et $(2^{63})-1$  | Non |
| uint64               | 17         | un nombre compris entre 0 et $(2^{64})-1$  | Non |
| float                | 18         | un nombre flottant interprétable en simple précision   | Non |
| double               | 19         | un nombre flottant interprétable en double précision   | Non |
| décimal              | 20         | un nombre décimal sans limite de stockage  | Oui |
| Chaîne de caractères | 21         | la chaîne de caractères  | Oui |
| Date (locale)        | 22         | un nombre entier (positif ou négatif) de secondes écoulées ou à venir depuis ou vers le <b>01/01/1970</b> qui est la référence ( <b>Unix Epoch</b> ). Cette date ne porte pas d'information de timezone (même pas l'UTC). Elle correspond donc à un temps local. | Oui |
| Time stamp           | 23         | un nombre entier (positif ou négatif) de secondes écoulées ou à venir depuis ou vers le <b>01/01/1970</b> qui est la référence ( <b>Unix Epoch</b> ). Contrairement au code 22, ce time stamp est exprimé en UTC.  | Oui |
| Couleur              | 24         | un nombre entier positif contenant la représentation en 24 ou 32 bits de la couleur. 24 bits = RRGGBB. 32 bits = TTRRGGBB ou TT est la transparence (0x00 = opaque, 0xFF = totalement transparent)   | Oui |
| Data                 | 25         | un nombre entier positif correspondant à la longueur originale en octets de la donnée transmise, suivi d'une chaîne de caractères contenant les données encodées en Base64.  | Oui |
| Natural array        | *26        | un nombre entier positif N correspondant au nombre d'entiers naturels positif contenus dans le tableau suivi de N entiers naturels (uniquement en version 1.2.1)   | Oui |
| <i>inutilisées</i>   | 27 -<br>29 |  |     |
| Dictionnaire         | 30         | un nombre entier positif N correspondant au nombre de couples clé-valeur du dictionnaire. Suivent ensuite N séquences clé-valeurs du dictionnaire.   | Oui |

| Type               | Code       | Suite attendue   | Ref |
|--------------------|------------|--|-----|
| Array              | 31         | un nombre entier positif N correspondant au nombre d'éléments du tableau. Suivent ensuite N séquences correspondants aux éléments du tableau.  | Oui |
| Couple             | 32         | 2 séquences de tokens correspondant au premier et au second membre du couple d'objets.   | Oui |
| <i>inutilisées</i> | 33 -<br>49 |  |     |
| Type personnalisé  | 50         | l'objet contenant le nom du type personnalisé suivi d'un nombre entier positif N correspondant au nombre de couples clé-valeur du dictionnaire. Suivent ensuite N séquences clé-valeurs du dictionnaire. | Oui |

### Tokens MSTE0101

| Type                 | Code | Suite attendue   | Ref |
|----------------------|------|--|-----|
| Objet null           | 0    | Aucune   | Non |
| Valeur "vraie"       | 1    | Aucune   | Non |
| Valeur "fausse"      | 2    | Aucune   | Non |
| Entier               | 3    | un nombre entier sans limite de stockage   | Oui |
| Décimal              | 4    | un nombre décimal sans limite de stockage  | Oui |
| Chaîne de caractères | 5    | la chaîne de caractères  | Oui |
| Time stamp           | 6    | un nombre entier (positif ou négatif) de secondes écoulées ou à venir depuis ou vers le <b>01/01/1970</b> qui est la référence ( <b>Unix Epoch</b> ).  | Oui |
| Couleur              | 7    | un nombre entier positif contenant la représentation en 24 ou 32 bits de la couleur. 24 bits = RRGGBB. 32 bits = TTRRGGBB ou TT est la transparence (0x00 = opaque, 0xFF = totalement transparent) | Oui |
| Dictionnaire         | 8    | un nombre entier positif N correspondant au nombre de couples clé-valeur du dictionnaire. Suivent ensuite N séquences clé-valeurs du dictionnaire.   | Oui |
| Référence            | 9    | 1 token contenant l'index dans le tableau des objets déjà décodés de l'objet à utiliser comme référence <b>FORTE</b> .   | Non |
| int8                 | 10   | un nombre compris entre -128 et +127   | Non |
| uint8                | 11   | un nombre compris entre 0 et 255   | Non |
| int16                | 12   | un nombre compris entre -32768 et +32767   | Non |
| uint16               | 13   | un nombre compris entre 0 et 65535   | Non |

| Type              | Code | Suite attendue   | Ref |
|-------------------|------|--|-----|
| int32             | 14   | un nombre compris entre $-(2^{31})$ et $(2^{31})-1$  | Non |
| uint32            | 15   | un nombre compris entre 0 et $(2^{32})-1$  | Non |
| int64             | 16   | un nombre compris entre $-(2^{63})$ et $(2^{63})-1$  | Non |
| uint64            | 17   | un nombre compris entre 0 et $(2^{64})-1$  | Non |
| float             | 18   | un nombre flottant interprétable en simple précision   | Non |
| double            | 19   | un nombre flottant interprétable en double précision   | Non |
| Array             | 20   | un nombre entier positif N correspondant au nombre d'éléments du tableau. Suivent ensuite N séquences correspondants aux éléments du tableau.  | Oui |
| Natural array     | 21   | un nombre entier positif N correspondant au nombre d'entiers naturels positif contenus dans le tableau suivi de N entiers naturels   | Oui |
| Couple            | 22   | 2 séquences de tokens correspondant au premier et au second membre du couple d'objets.   | Oui |
| Data              | 23   | un nombre entier positif correspondant à la longueur originale en octets de la donnée transmise, suivi d'une chaîne de caractères contenant les données encodées en Base64.                              | Oui |
| Date passé        | 24   | Date infinie dans le passé.  | Oui |
| Date future       | 25   | Date infinie dans le futur.  | Oui |
| Chaîne vide       | 26   | Aucune   | Non |
| Référence         | 27   | 1 token contenant l'index dans le tableau des objets déjà décodés de l'objet à utiliser comme référence <b>FAIBLE</b> .  | Non |
| Type personnalisé | 50   | l'objet contenant le nom du type personnalisé suivi d'un nombre entier positif N correspondant au nombre de couples clé-valeur du dictionnaire. Suivent ensuite N séquences clé-valeurs du dictionnaire. | Oui |
| Type personnalisé | 51   | l'objet contenant le nom du type personnalisé suivi d'un nombre entier positif N correspondant au nombre de couples clé-valeur du dictionnaire. Suivent ensuite N séquences clé-valeurs du dictionnaire. | Oui |

## Exemples

### Une chaîne de caractères

```
"toto" // json
["MSTE0102",7,"CRCD45ACB10",0,0,21,"toto"]
["MSTE0101",7,"CRC2B8F345A",0,0,5,"toto"]
```

## Un tableau

```
["toto"] // json
["MSTE0102",9,"CRCD4E14B75",0,0,31,1,21,"toto"]
["MSTE0101",9,"CRC43E85E76",0,0,20,1,5,"toto"]
```

```
["toto", "tata", "toto"] // js
["MSTE0102",13,"CRC7311752F",0,0,31,3,21,"toto",21,"tata",9,1]
["MSTE0101",13,"CRC0F51FFA9",0,0,20,3,5,"toto",5,"tata",9,1]
```

## Un dictionnaire

```
{"mykey":"toto"} // js
["MSTE0200",30,1,"mykey",21,"toto"]
["MSTE0102",11,"CRC1C9E9FE1",0,1,"mykey",30,1,0,21,"toto"]
["MSTE0101",11,"CRC7356C782",0,1,"mykey",8,1,0,5,"toto"]
```

```
[{"mykey":"toto"}, {"mykey":"toto"}] // js
["MSTE0102",18,"CRCDF6E36C0",0,1,"mykey",31,2,30,1,0,21,"toto",30,1,0,9,2]
["MSTE0101",18,"CRCCA3A73E2",0,1,"mykey",20,2,8,1,0,5,"toto",8,1,0,9,2]
```

```
t = {"mykey":"toto"}, [t, t] // js
["MSTE0102",15,"CRCFFC790D3",0,1,"mykey",31,2,30,1,0,21,"toto",9,1]
["MSTE0101",15,"CRCB3BA14EE",0,1,"mykey",20,2,8,1,0,5,"toto",9,1]
```

## Un type personnalisé

```
class Person {
  firstName: string;
  lastName: string;
  mother?: Person;
  father?: Person;
  childrens: Person[];

  constructor(initValues: { firstName: string, lastName: string }) { ... }
  setMSTValues(values: { mother?: Person, father?: Person, childrens: Person[]
}) { ... }
}
let son = new Person({ firstName:"Mickey", lastName: "Mouse" });
let mother = new Person({ firstName:"Mother", lastName: "Mouse" });
```

```
let father = new Person({ firstName:"Father", lastName: "Mouse" });
son.mother = mother; mother.childrens.push(son);
son.father = father; father.childrens.push(son);
son;
```

```
["MSTE0102",49,"CRCAF1171C0",0,5,"childrens","firstName","lastName","mother","father",30,5,0,31,0,1,21,"Mickey",2,21,"Mouse",3,30,3,0,31,1,9,0,1,21,"Mother",2,9,3,4,30,3,0,31,1,9,0,1,21,"Father",2,9,3]
```
