Description

Data is requested using the login or link endpoint view giving space delimited scopes in the `fd_scopes` get parameter just to get closer to the authorization request format.

Data is stored in a dictionary of scopes in the session, not in a list, and rename it fc-data.

Build FD request url using urlencode.

Historique

- prefer using `django.utils.http.urlencode` than `urllib.urlencode` which does not handle unicode strings
- ugly

```
[fc_data.setdefault(k, []).extend(v) for k, v in self.data.items()]
```

I would just do the following as I do not think we need to keep many version of the same data:

```
request.session['fc-data'] = self.data
```

- too much wrapping, we accept 100 characters line now in all our projects.

```
self.logger.debug('fc data in session %s',  
self.request.session['fc-data'])
```

maybe we could just log the data received, i.e. `self.data`, not `fc_data`.

Anyway it's a bit too early to do anything complicated around FD as we still do not know how we are gonna use them in the future, probably we will use some kind of proxy oauth2 view to request access to proxy web-service view targeting the fd (as in the OAuth2 backend for `mon.service-public.fr`).

Ok on your last remarq and `django.utils.http.urlencode` and too much wrapping.

I would prefer to keep for now in session all ressources resolved, then merging the two dicts of lists, do you prefer ?

```
for scope in self.data:  
    fc_data.setdefault(scope, []).extend(self.data[scope])
```

Yes it's more readable. Ack for all.
