The check was removed. But I also made straight the error code for missing keys or chain of cert when checking signatures:
- if a public keys or chain of cert was put, and we cannot load it, we return an error in the LASSO_DS_ERROR namespace (like PUBLIC_KEY_LOADING_FAILED OR CHAING_OF_CERT_LOADING_FAILED).
- if there is no public key (and no chain of cert for XML signatures) we return LASSO_PROVIDER_ERROR_MISSING_PUBLIC_KEY.

- if there is no public key (and no chain of cert for XML signatures) we return LASSO_PROVIDER_ERROR_MISSING_PUBLIC_KEY.

It is ok when loading provider into Lasso::Server object, but I still have the check when I load Lasso::Server from dump.
