Description			
<pre>valid_email parameter is used to tell if an email is already valid has been provided. By default, it is True like the previous behaviour. If it is False, an email field is added to the form, prefilled if there's a value in the token. If an value value is submitted : * Either the email value is the same as in the token (the user confirms it), then the validation email sending is skipped. * Or it is different and a validation email is sent. confirm_data parameter is used to tell that even if all the data in the token match the form fields, a user confirmation is necessary. That result in displaying the prefilled form. By default, confirm_data is False like the previous behaviour.</pre>

Add valid_email and confirm_data to RegistrationCompletionView (fixes #10508).

```
valid_email parameter is used to tell if an email is already valid has been provided.
By default, it is True like the previous behaviour. If it is False, an email field
is added to the form, prefilled if there's a value in the token.
If an value value is submitted :
    * Either the email value is the same as in the token (the user confirms it),
      then the validation email sending is skipped.
    * Or it is different and a validation email is sent.
```

```
confirm_data parameter is used to tell that even if all the data in the token match
the form fields, a user confirmation is necessary. That result in displaying the
prefilled form. By default, confirm_data is False like the previous behaviour.
```

It makes no sense to me that it should be an option, I think that the backend should just state to the registration page that the email is already validated.

#3 - 31 mars 2016 22:49 - Mikaël Ates

I think the 'ou' is not well handled also.

#4 - 01 avril 2016 17:52 - Mikaël Ates

Use a single setting A2_AUTH_FC_AUTO_REGISTER (One setting per module)

No need for registration_form_prefill().

It needs a view /accounts/fc/register/ redirecting to

```
build_activation_url(next_url=requests.GET.get('next_url'), email=fc_user_info['email'], valid_email=True, other fields,
```

confirm_data=not app_settings.A2_AUTH_FC_AUTO_REGISTER)

In RegistrationCompletionView() it needs to modify get_form_class() to add a field email if self.token.get('confirm_data') is True, and, if the email submitted is different from self.token['email'] to send a registration email (without confirm_data=True).

It lets feasible to go back a single page with profil field and email with A2_REGISTER_EMAIL_FIRST=False. It brings to a prefill registration form.

It needs also to modify send_registration_mail() to send valid_email=True.

I modified the patch concerning the registration template names.

This patch used the patch of 10600 that was a bad idea.

Instead I use 10635 that should be a better way.

I put legacy_template_names in the module to reuse it 10601.
