Patch proposed:			
Description			
<p>We can add lot of verification between request/response (that the ID match, that the reponse is qualified toward the SP, etc....), but there will always be thing we cannot verify inside Lasso, like the IP of the client (if the IdP add it as a verification means to the AuthnResponse) or if the notBefore, notAfter attribute are respected (we are not sure of the time at the SP).</p> <p>We should explicitly mention all those things that the SP could and should verify aroun SAML exchanges but that are not in the scope of Lasso. It should eventually be a section of the documentation.</p>
