Patch proposed:	Non		
Description (more background in my "portail admin, 1st draft" email, dated March 25th 2014) The master portail-admin instance expose a list of portail-admin as /hobos.json, it's a simple list of base URLs. (you can use a single portail-admin instance and it will also advertise itself in that file, to make it easier to start developing). For each of those URLs, there is a /environment/installed_services.json, that contains the list of configured services, for example: <pre>[{ "base_url": "http://ma-ville.example.net", "id": 1, "service-id": "authentic", "slug": "idp-de-ma-ville", "title": "Ma ville" }]</pre> The management command should then create appropriate tenants for matching services.

- Patch proposed mis à Non

I seems to me that the job is common to all Django project that will need to deploy tenants from hobo, could the job be done in a Django app living in hobo (maybe called hobo), we could relocate the tenant middleware and template loaders from python-entrouvert there also. It would centralize all code needed to make multi-tenant Django app at EO.
