

Authentic 2 - CAS - # 2

CAS 1.0 and 2.0

- [Specification](#)

How it works in authentic ?

There is a new module `authentic/cas.py`. It implements the five endpoints:

- `/cas/login`
- `/cas/validate`
- `/cas/serviceValidate`
- `/cas/proxy`
- `/cas/proxyValidate`

Still missing is a way to limit use of the service for specific endpoints and to control use of the proxying ticket by services.

The configuration page is on `/admin/settings/cas`.
